

Information Sheet

Using Midazolam Nasal Spray

Why is Midazolam nasal spray prescribed?

Midazolam is found to be effective for managing breathlessness and associated anxiety and is easy to self-administer with a nasal spray. Patients often report it helps them control symptoms more easily.

What are possible side effects?

It is rapidly absorbed by the nasal mucosa and has peak effect within 10 minutes. Used as a nasal spray the doses are small and so it is not usually sedating in these amounts.

Some people experience irritation of the nasal passage and in this situation find it easier to spray it into the inside of their cheeks where it is just as easily absorbed.

Instructions for use

- Hold bottle with thumb at base and nozzle between 1st and 2nd fingers.
- Depress the pump until the spray is visible.
- Keep your head upright and insert nozzle into nostril.
- Keep spray bottle upright.
- Depress pump with a firm even stroke - you do **not** have to sniff.
- **Do not** tilt your head back while spraying. Having head upright is preferable to avoid swallowing of solution, but not absolutely essential.
- Administer one spray at a time into alternate nostril until prescribed dose is administered.
- If this is difficult or irritating to your nasal passage spray can be applied into inside of your cheeks.
- Contents of bottle **expire one month** after opening.
